

Airport Signs on PDAs

Even if you normally fly from a grass strip in the middle of nowhere, you still need to understand runway markings.

And, there has been some new equipment added recently to combat runway incursions that you must know how to interpret before your next trip to a towered or larger airport—and certainly before you take your next checkride.

Airport Signs, by Production Software, is a simple program for personal digital assistants (PDAs) that helps you to review 30 different runway markings, lights, and signs. References to the appropriate section of the *Aeronautical Information Manual* and newly implemented Surface Movement Guidance and Control System standards are included for further study.

The *Airport Signs* program requires a Palm-based device running OS 3.5 or higher, and it works on both color and black-and-white PDAs. Production Software also offers other programs for purchase or as freeware that allow you to look up airport identifiers, airline codes, and commonly used pilot and aviation terminology.

Price: \$6.95. For more information: www.pspda.com; support@pspda.com
